

THE RIGHT CARE IS IMPORTANT

PROPER CLEANING AND DRYING

Simply wash off the dirty shoes with water and a brush. Do not attempt to “quick-dry” wet shoes on an open fire, hot oven or heater. Remove the insoles and stuff the shoes with newspaper or use a shoe tree. Afterwards, allow the shoes to dry slowly and in a well-ventilated area. We recommend washing the insole regularly at 30°C. You should remove the insole from the shoes after every wear for a faster drying process.

CARE WITH WATERPROOFING SPRAYS AND SHOE POLISH

For all leather types, you should use the HAIX® products or commonly available non-greasy shoe care and waterproofing agents. Do not use leather grease or leather oil. Textile upper materials are best maintained with a waterproof spray. Waterproof sprays alone can excessively dry out the leather. Without shoe cream care, the leather can become cracked and hard. Applying cream in the fold area of the tongue can also eliminate squeaking noises that may occur with hydrophobic leather. Additionally, applying cream provides extra protection against oxidation for metal parts.

HAIX® SHOES WITH THE SUN REFLECT SYSTEM

Sun Reflect reduces the heating effect of black upper leather when exposed to sunlight. Sunlight is reflected by the leather, keeping leather and feet cooler. To maintain the effect, we recommend the black care product with SUN REFLECT pigments from HAIX®.

CARE OF HAIX® SUEDE SHOES

Treat the shoes with the HAIX® suede leather care product and the waterproofing spray. First apply the shoe care product and then the spray generously at a distance of 30 cm, allowing the leather to absorb the care substances. The shoes must then dry in a quiet place (not near a heater). If necessary, the suede can be roughened again with a brush.
